AHIR UNIAHAD) SARAHES: OERAMIERIO:

TO ALL TO WHOM THESE: PRESENTS SHALL COME;

The Ghio State University, Ohio Agricultural Research and Bevelopment Center

Wilhereus. There has been presented to the

Secretary of Agriculture

AN APPLICATION REQUESTING A CERTIFICATE OF PROTECTION FOR AN ALLEGED NOVEL VARIETY OF SEXUALLY REPRODUCED PLANT, THE NAME AND DESCRIPTION OF WHICH ARE CONTAINED IN THE APPLICATION AND EXHIBITS, A COPY OF WHICH IS HEREUNTO ANNEXED AND MADE A PART HEREOF, AND THE VARIOUS REQUIREMENTS OF LAW IN SUCH CASES MADE AND PROVIDED HAVE BEEN COMPLIED WITH, AND THE TITLE THERETO IS, FROM THE RECORDS OF THE PLANT VARIETY PROTECTION OFFICE, IN THE APPLICANT(S) INDICATED IN THE SAID COPY, AND WHEREAS, UPON DUE EXAMINATION MADE, THE SAID APPLICANT(S) IS (ARE) ADJUDGED TO BE ENTITLED TO A CERTIFICATE OF PLANT VARIETY PROTECTION UNDER THE LAW.

NOW, THEREFORE, THIS CERTIFICATE OF PLANT VARIETY PROTECTION IS TO GRANT UNTO THE SAID APPLICANT(S) AND THE SUCCESSORS, HEIRS OR ASSIGNS OF THE SAID APPLI-CANT(S) FOR THE TERM OF eighteen YEARS FROM THE DATE OF THIS GRANT, SUBJECT TO THE PAYMENT OF THE REQUIRED FEES AND PERIODIC REPLENISHMENT OF VIABLE BASIC SEED OF THE VARIETY IN A PUBLIC REPOSITORY AS PROVIDED BY LAW, THE RIGHT TO EX-LIDE OTHERS FROM SELLING THE VARIETY, OR OFFERING IT FOR SALE, OR REPRODUCING IT. CORTING IT, OR EXPORTING IT, OR USING IT IN PRODUCING A HYBRID OR DIFFERENT THEREFROM, TO THE EXTENT PROVIDED BY THE PLANT VARIETY PROTECTION ACT. NITED STATES SEED OF THIS VARIETY (1) SHALL BE SOLD BY VARIETY NAME ONLY AS CERTIFIED SEED AND (2) SHALL CONFORM TO THE NUMBER OF GENERATIONS THE OWNER OF THE RIGHTS. (84 STAT. 1542, AS AMENDED, 7 U.S.C. 2321 ET SEQ.)

Exhibit A

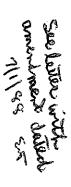

Origin and Breeding History of the Variety

- 1. Cardinal (previously designated OH 244) originated at The Ohio State University, Ohio Agricultural Research and Development Center from the complex cross: Logan 2 $^{\circ}/3/Va$ 63-52-12/Logan//Blueboy. The final cross was made in 1971 and designated 2071. Cardinal was first selected in 1974 as an F $_3$ plant and designated 2071ABC-12. It was reselected in 1981 in the F $_{10}$ generation as described below.
- 2. Breeder seed of Cardinal consists of the progeny of 39 F₁₀ plants selected for uniformity in 1981-1984 and bulked after 1984 harvest to constitute Breeder seed. Breeder seed was seeded in fall, 1984. Foundation generation seed was produced in the 1985-86 crop season with the first distribution of Foundation generation seed made in the fall, 1986 to producers of Registered or Certified classes of seed.
- 3. Cardinal appears to be very uniform and homozygous as observed in the field over the past six seasons. This would be expected of the progeny of phenotypically identical plants selected in the F_{10} and reexamined for uniformity in the F_{11} through the F_{13} generations. (Originally 60 F_{10} plants were selected as being identical in the F_{10} generation, however, continued observation for uniformity in the F_{11} through F_{13} generations resulted in the progeny of only 39 of these being bulked after harvest of the F_{13} generation in 1984.)
- 4. Cardinal appears to very stable and true breeding as evidenced by agronomic and pathological examination of the F_{10} through F_{13} generations in special purification and increase nurseries.
- 5. Variants observed during the development of the variety were few in number and of various, non-repeating types. In the 1986 Foundation generation production fields some off types were observed including short, awned plants, plants with long tip awns and lax heads. Occasionally reported were awnless, red chaff types also. The total of all such types did not exceed .0125%.

Roguing of all observed off-types was performed four times in the Breeder seed increase of 1984-85 and three times in the Foundation generation increase of 1985-86.

Criteria for selection during the multiplication and purification process in the F_{11} - F_{13} generations allowed no variance from complete uniformity. If one off-type plant was observed in a 10' row, that plant was either rogued or the entire row dropped from further increase. If two or more off-type plants were observed within a row, the row was eliminated from further increase.

6. The variety was selected primarily for high yielding ability and extreme straw strength. Additionally, selection for all other important agronomic, pathologic, and quality traits were exercised. The variety was selected in comparison to popular varieties in Ohio, namely, Adena, Becker, Hart, Titan, and Tyler.

AMENDMENT TO PARAGRAPH 5, EXHIBIT A.

Ohio Agricultural Research and Development Center

Department of Agronomy 1680 Madison Avenue Wooster, OH 44691-4096

Phone 216-263-3878

July 1, 1988

Dr. Kenneth H. Evans, Commissioner Plant Variety Protection Office National Agricultural Library Bldg., Rm 500 Beltsville, MD 20705

Dear Ken:

During the past three growing seasons I have had the opportunity to inspect several breeder seed fields of Cardinal soft red winter wheat. In the course of these inspections it has become obvious that a phenotypic variant exists in the variety which was not previously described, thus, I am hereby requesting an amendment be added to Exhibit A, Section 5, paragraph 1 of our Application for Plant Variety Protection Certificate (PV #8700146, Wheat) to read as follows:

5. Variants observed during the development and increase of the variety were few in number and of various, non-repeating types with the following exceptions: In the past three seasons inspection of breeder seed fields have revealed the presence of awned, red and white chaffed plants, plants with long tip awns and lax heads, and plants which are red chaffed and awnless. The total of all such types does not exceed .3% (3/1000).

(Paragraphs 2 and 3 unchanged.)

Thank you for your consideration.

Sincerely yours,

Howard N. Lafever

Howard M. Lofever

Professor

HNL:je

Exhibit B

Novelty Statement and Botanical Description of the Variety

Cardinal is an awnless cultivar, but possesses apical awnlets. It is midseason in maturity and is a moderately short cultivar, averaging 5 cm shorter than Tyler, 2.5 cm shorter than Hart and Titan, but is 12.5 cm taller than Becker. Cardinal has exhibited excellent straw strength in Ohio and region-wide tests, exceeding all currently grown cultivars except Becker and GR 855 in straw strength. Winterhardiness of Cardinal is excellent, equaling that of the best currently grown cultivars in Ohio tests and exceeding numerous soft wheat cultivars except Charmony in severe tests in the upper Midwest.

Test weight of Cardinal is high, averaging .5 lb/bu below that of Hart. The Yield record of Cardinal is outstanding.

The USDA Soft Wheat Quality Laboratory, Wooster, Ohio in evaluations of samples of Cardinal has found it to possess excellent milling and baking quality.

Cardinal possesses excellent resistance to leaf rust (<u>Puccinia recondita</u>), but is only moderately resistant to powdery mildew (<u>Erysiphe graminis</u>). It is also very resistant to wheat spindle streak mosaic virus (WSSM). Cardinal possesses resistance to races GP, A, C, and F races of Hessian fly (<u>Mayetoila destructor</u>, Say) imparted by the $\rm H_2$ gene.

Cardinal also possesses excellent tolerance to soil aluminum, often a problem in acid eastern soils, being nearly as tolerant as Seneca which is thought to be the most tolerant soft red winter wheat ever grown in the eastern soft wheat region.

Cardinal has dark green foliage. At maturity its large fusiform heads are held mostly erect and possess white chaff.

Cardinal most closely resembles Titan, however, it averages 1 inch shorter and two days earlier in heading. it also exhibits greater leaf rust resistance, WSSM resistance, and a more erect growth habit as a juvenile plant.

GENERAL: The following publications may be used as a reference aid for the standardization of terms and procedures for completing this form:

- (a) L.W. Briggle and L. P. Reitz, 1963, Classification of Triticum Species and Wheat Varieties Grown in the United States, Technical Bulletin 1278, United States Department of Agriculture.
- (b) W.E. Walls, 1965, A Standardized Phenol Method for Testing Wheat Seeds for Varietal Purity, contribution No. 28 to the handbook of seed testing prepared by the Association of Official Seed Analysts. (See attachment.)

LEAF COLOR: Nickerson's or any recognized color fan should be used to determine the leaf color of the described variety.

Exhibit D

Additional Description of the Variety

Heads of Cardinal plants are best described as dense (Item 11, Exhibit C), however, they are actually more nearly intermediate in density than many varieties described as dense. Heads are mostly erect at maturity.

The variety is apically awnleted with tip awns measuring up to $20\text{-}23~\mathrm{mm}$ in length.

Plants of the Cardinal variety are robust, tiller somewhat profusely and have large diameter stems.

Coleoptile color is reported as purple (Exhibit C, item 13), however, purpling is not intense nor does it involve the entire coleoptile.

Seedling anthocyanin is reported as absent (Exhibit C, item 14), however, traces of purpling are occasionally observed on seedling plants.

Exhibit E

Statement of the Basis of Applicant's Ownership

The originating complex cross, early line evaluation, selection, reselection, testing, purification and final multiplication were all performed by the applicant breeder (Dr. H. N. Lafever) or his technical assistants on the property of The Ohio State University, Ohio Agricultural Research and Development Center utilizing funds provided for such research. The variety is intended for release as a public variety in the United States.

The Ohio State University Ohio Agricultural Research and Development Center Wooster, Ohio

RELEASE OF CARDINAL SOFT RED WINTER WHEAT

The Ohio State University, Ohio Agricultural Research and Development Center announces the release of 'Cardinal' soft red winter wheat, a new, highly productive cultivar.

Cardinal (previously designated OH 244) resulted from the complex cross: Logan 2*/3/Va63-52-12/Logan//Blueboy. First selected in 1974 as an F_3 plant, Cardinal was reselected in 1981 in the F_{10} generation. Breeder seed consists of the bulked progeny of 39 F_{10} plants selected for uniformity in 1981 and succeeding years.

Cardinal was first tested in advanced trials in Ohio in 1981. At the end of the 1985 season it had been tested in 25 state-wide advanced trials over 5 years of testing. Cardinal also has been an entry in the Uniform Eastern Soft Red Winter Wheat Nursery since 1983.

Cardinal is an awnless cultivar with mid-season maturity. It is a moderately short cultivar averaging 5 cm shorter than Tyler, 2.5 cm shorter than Hart and Titan, and 12.5 cm taller than Becker. Cardinal has exhibited excellent straw strength in Ohio and region-wide tests exceeding all currently grown cultivars except Becker and GR855 in straw stength. Winterhardiness of Cardinal is excellent, equaling that of the best currently grown cultivars in Ohio tests and exceeding numerous soft wheat cultivars except Charmony in severe tests in the upper Midwest.

Test weight of Cardinal is high, averaging .5 1b/bu below that of Hart. The yield record compiled by Cardinal is outstanding (Tables 1-3).

The USDA Soft Wheat Quality Laboratory, Wooster, Ohio in evaluations of samples of Cardinal has found it to possess excellent milling and baking quality (Table 4).

Cardinal possesses excellent resistance to leaf rust (Puccinia recondita) but is only moderately resistant to powdery mildew (Erysiphe graminis). It is also very resistant to wheat spindle streak mosaic virus (WSSM). Cardinal possesses resistance to Races A and C only of Hessian fly (Mayetiola destructor).

Cardinal has dark green foliage. At maturity its fusiform heads are held mostly erect and possess white chaff.

Application for Plant Variety Protection under the certification option will be made for Cardinal. The classes Foundation, Registered, and Certified will be allowed beyond Breeder seed.

Breeder seed of Cardinal will be maintained by the Ohio State University, Ohio Agricultural Research and Development Center, Wooster, Ohio, 44691. Seedings for the production of Foundation generation seed were first made in Ohio, Indiana, and Illinois in the fall of 1985.

Release of information to the general public regarding the name, release or description of Cardinal may be made at any time.

Fred Hutchinson, Director The Ohio State University

Ohio Agricultural Research and

Development Center

 1 Denotes lines dropped from breeding program following 1986 season. 2 % - class (OARDC, Wooster, only).

Quality Evaluation of Cardinal (Data taken from U.S.D.A. Soft Wheat Quality Laboratory Reports)

Soft wheat quality tests of composite samples of 13 lines and varieties grown at 6 locations in 1985 in Ohio revealed Cardinal received a combined quality score of 101.9. Comparative scores for Adena, Becker, Titan, and Tyler were 88.9, 100, 81.7, and 82.1, respectively.

In evaluations of composite samples of 14 lines and varieties grown at 6 locations in Ohio in 1984, Cardinal (OH 244) received a combined quality score of 103. Comparative scores of Adena, Becker (OH 234), Hart, Tyler, and Titan were 100, 85, 78.3, 70.5, and 60.9, respectively.

In evaluations of composite samples of 16 lines and varieties grown at 7 locations in Ohio in 1983, Cardinal (OH 244) received a combined quality score of 97.3 while Adena, Becker (OH 234), Hart, Titan, and Tyler received combined scores of 100, 92, 89.7, 85.7 and 79.9, respectively.

No 1986 quality data is yet available.

These and other tests reveal that the baking and milling quality of Cardinal is excellent as a soft red winter wheat.

(See attached Tables 1-3)
